Exercise 03-03 - Using Diagnostics

Explanation

One of the possible solutions for this exercise is in solution/solution.sch:

The message is now in a diagnostic that is reference by identifier from the assert.

Adding multiple messages can be done as follows (solution/solution-extra.sch):

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt3">
   <rule context="thing">
     <assert test="(@type eq 'normal') or (@type eq 'special')" diagnostics="message-1 things-</pre>
message"/>
  </pattern>
  <pattern>
   <rule context="artifact">
      <assert test="(@type eq 'martian') or (@type eq 'zorkian')" diagnostics="message-1 artifacts-</pre>
  </pattern>
  <diagnostics>
    <diagnostic id="message-1"> Invalid type on <value-of select="@name"/>: <value-</pre>
of select="@type"/></diagnostic>
    <diagnostic id="things-message">Things must be normal or special</diagnostic>
    <diagnostic id="artifacts-message">Artifacts must be martian or zorkian/diagnostic>
  </diagnostics>
</schema>
```
